METATRON PROTOCOL V3 — Complete Deployment Guide

Budget: $75 · Network: Base (Ethereum L2) · Permanent: Arweave

---

YOUR COMPLETE CHECKLIST

- ☐ Step 1 — Install MetaMask
- ☐ Step 2 — Add Base Network
- ☐ Step 3 — Buy ETH on Coinbase
- ☐ Step 4 — Bridge ETH to Base
- ☐ Step 5 — Deploy contract on Remix
- ☐ Step 6 — Verify on Basescan
- ☐ Step 7 — Update CONTRACT_ADDRESS in frontend
- ☐ Step 8 — Deploy frontend (free)
- ☐ Step 9 — Add Arweave real integration
- ☐ Step 10 — Add ethers.js for clean transactions
- ☐ Step 11 — First recalibration — you start earning

STEP 1 — MetaMask Setup

1. Go to **metamask.io** → Download for your browser
2. Create new wallet → **Save your seed phrase somewhere safe — this is everything**
3. You'll use this same MetaMask for deploying AND receiving revenue

---

STEP 2 — Add Base Network to MetaMask

In MetaMask → Settings → Networks → Add Network → Add manually:

Field	Value
Network Name	Base
RPC URL	https://mainnet.base.org
Chain ID	8453
Currency Symbol	ETH
Block Explorer	https://basescan.org

Or visit **base.org** and click "Add Base to MetaMask" automatically.

STEP 3 — Buy ETH ($75)

Option A — Coinbase (easiest, Base is Coinbase's chain):

1. Create account at coinbase.com
2. Buy $75 of ETH
3. Send to your MetaMask address

Option B — Buy directly into MetaMask: MetaMask has a built-in buy feature using debit card.

Budget allocation: | Item | Cost | |------|------| | Contract deployment gas | ~$0.50 | | Basescan verification | Free | | First test recalibration | ~$0.75 | | Arweave storage (1000 profiles) | ~~$0.10~~ | ~~**Reserve for operations**~~ | ~~**~~$73.65** |

STEP 4 — Deploy Contract on Remix (Free)

1. Go to **remix.ethereum.org** (no install needed)
2. In the file explorer, create: `MetatronProtocolV3.sol`
3. Paste the entire contract code from `MetatronProtocolV3.sol`
4. In the **Solidity Compiler** tab:

- Version: `0.8.26`
- Enable optimization: **YES**
- Runs: `200`
- Click **Compile MetatronProtocolV3.sol**

5. In the **Deploy & Run** tab:

   - Environment: **Injected Provider — MetaMask**
   - Make sure MetaMask shows **Base Mainnet**
   - Contract: `MetatronProtocolV3`
   - Fill constructor arguments:
     - `_maintenanceFund`: **A second wallet address you control** (receives 10%)
     - `_contributorPool`: **A third wallet address you control** (receives 10%)
     - *(You can use the same MetaMask address for all three initially)*

6. Click **Deploy** → Confirm in MetaMask (~$0.50 gas)

7. **COPY YOUR CONTRACT ADDRESS** — appears in the left panel after deployment

---

STEP 5 — Verify on Basescan (Critical for Trust)

1. Go to **basescan.org**
2. Search your contract address
3. Click **Contract** tab → **Verify and Publish**
4. Settings:
   - Compiler: Solidity (Single file)
   - Version: v0.8.26
   - Optimization: Yes, 200 runs
   - License: MIT
5. Paste your contract source code
6. Click Verify

Once verified, anyone can read:

- The 432 Hz constant baked in forever
- The 90% alignment floor
- The exact revenue split
- The eternal endowment vault

This is what builds trust. The code is the contract.

STEP 6 — Update Frontend

In `MetatronApp.jsx`, line 10:

```
// CHANGE THIS:

const CONTRACT_ADDRESS = "0xYOUR_CONTRACT_ADDRESS_HERE";

// TO YOUR ACTUAL ADDRESS:

const CONTRACT_ADDRESS = "0x1234...abcd"; // your deployed address
```

STEP 7 — Add ethers.js (Proper Transaction Encoding)

Install ethers.js in your project:

```
npm install ethers
```

Replace the `handleCommit` function's transaction section with:

```
import { ethers } from "ethers";

// Inside handleCommit:

const provider = new ethers.BrowserProvider(window.ethereum);

const signer = await provider.getSigner();

const contract = new ethers.Contract(CONTRACT_ADDRESS, CONTRACT_ABI, signer);

const birthHashBytes = ethers.keccak256(

  ethers.AbiCoder.defaultAbiCoder().encode(

    ["uint256","uint256","uint256"],

    [matrix.year, matrix.month, matrix.day]
```

```
  )
);
const vedicHashBytes  = ethers.keccak256(ethers.toUtf8Bytes(JSON.stringify({ sign: matrix.western.sign, nakshatra: matrix.nakshatra.name })));
const corpusHashBytes = ethers.keccak256(ethers.toUtf8Bytes(corpusText));
const price = await contract.getCurrentPrice();
const tx = await contract.recalibrate(
  birthHashBytes,
  vedicHashBytes,
  corpusHashBytes,
  arweaveTxId,
  matrix.western.sign,
  matrix.nakshatra.name,
  matrix.lifePath,
  { value: price }
);
const receipt = await tx.wait();
setTxHash(receipt.hash);
```

STEP 8 — Real Arweave Integration

Replace the `uploadToArweave` function:

```
import Irys from "@irys/sdk";
```

```
// npm install @irys/sdk

async function uploadToArweave(content) {

  const provider = new ethers.BrowserProvider(window.ethereum);

  const signer = await provider.getSigner();

  const irys = new Irys({

    network: "mainnet",

    token: "ethereum",

    wallet: { name: "ethersv6", provider: signer },

  });

  const tags = [

    { name: "Content-Type", value: "application/json" },

    { name: "App-Name", value: "MetatronProtocolV3" },

    { name: "Protocol", value: "432Hz-Recalibration" },

  ];

  const receipt = await irys.upload(content, { tags });

  return receipt.id; // Arweave TxId — permanent forever

}
```

Cost: ~$0.00001 per profile upload. 1 million profiles = ~$10 total.

STEP 9 — Deploy Frontend (Free Options)

Option A — Vercel (Recommended, free forever for this scale):

npm install -g vercel

vercel deploy

Option B — Netlify: Drag and drop your build folder at netlify.com

Option C — IPFS (Fully decentralized):

npm install -g fleek-cli

fleek sites deploy

Fleek hosts on IPFS — your frontend also becomes permanent.

STEP 10 — Revenue Flow Verification

After your first real recalibration, verify on Basescan:

1. Search your contract address
2. Click **Internal Transactions**
3. You'll see three automatic transfers:
    - 60% → your architect wallet (immediate)
    - 10% → maintenanceFund wallet (immediate)
    - 10% → contributorPool wallet (immediate)
    - 20% → stays in contract (endowment vault, growing forever)

PRICING TRAJECTORY

Tier	**Total Recalibrations**	**Price (ETH)**	**~USD***
0	0–999	0.0003	$0.75
1	1,000–1,999	0.00033	$0.83
2	2,000–2,999	0.000363	$0.91
5	5,000–5,999	0.000483	$1.21
10	10,000–10,999	0.000778	$1.95

Tier	Total Recalibrations	Price (ETH)	~USD*
20	20,000–20,999	0.002018	$5.05
30	30,000–30,999	0.005236	$13.09

*At ETH = $2,500. Price compounds per tier.

REVENUE PROJECTIONS (Your 60%)

Recalibrations	Avg Price	Gross	Your 60%
1,000	$0.78	$780	$468
5,000	$0.94	$4,700	$2,820
10,000	$1.33	$13,300	$7,980
25,000	$2.76	$69,000	$41,400
50,000	$7.62	$381,000	$228,600

ENDOWMENT VAULT — The Forever Fund

The 20% endowment accumulates autonomously in the contract. It can NEVER drop below 1 ETH (the eternal floor). Only surplus above 1 ETH can be accessed by you for maintenance.

When the vault reaches:

- **1 ETH** — Protocol floor secured forever
- **10 ETH** — Significant operating reserve
- **100 ETH** — Fully self-sustaining protocol treasury

SEALING THE PROTOCOL (When Ready)

Once you're satisfied with the configuration, call `sealProtocol()`:

In Remix → Deploy tab → Find deployed contract → `sealProtocol` → Transact

After sealing:

- Revenue splits are permanent and unchangeable
- The 432 Hz constant is immutable
- The 90% alignment floor is locked
- The protocol belongs to everyone forever

Do not seal until you're certain of all addresses and parameters.

EMERGENCY: If Something Goes Wrong

Wrong network? Switch MetaMask to Base and retry.

Transaction failed? Check you have enough ETH for gas + fee.

Contract not found? Verify CONTRACT_ADDRESS is correct in the frontend.

Arweave upload fails? The corpus hash still gets recorded on-chain. Arweave can be added later — the blockchain proof is what matters first.

Lost your contract address? Check your MetaMask transaction history — it's there.

TOTAL COST SUMMARY

Item	**Cost**
ETH purchase	$75.00
Contract deployment	~$0.50
Verification	Free
Frontend hosting (Vercel)	Free
Arweave (first 10,000 profiles)	~$0.10
Total	**~$75.60**

You are $0.60 over budget — covered by your first recalibration revenue.

Metatron Protocol V3 — The living emotional backbone of aligned intelligence. Deployed on Base. Stored on Arweave. Anchored to 432 Hz. Alive forever.
